A GENERAL CATALOGUE OF THE PRINCIPAL FIXED STARS

FROM OBSERVATIONS

MADE AT

THE HONORABLE

THE EAST INDIA COMPANY'S OBSERVATORY

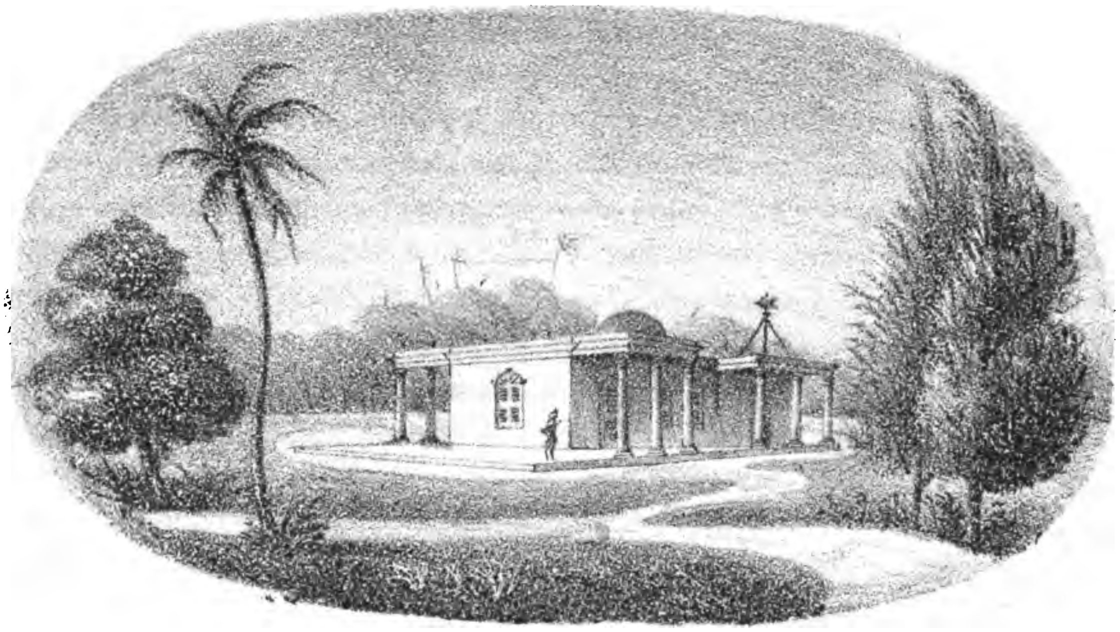
AT MADRAS

IN THE YEARS 1830—1843

BY

THOMAS GLANVILLE TAYLOR, ESQ. F.R.S. F.R.A.S.,

ASTRONOMER TO THE HONORABLE COMPANY



PRINTED BY ORDER OF THE MADRAS GOVERNMENT,

MADRAS:

PRINTED BY R. W. THORPE, AT THE CHRISTIAN KNOWLEDGE SOCIETY'S PRESS.

MDCCCXLIV.

PREFACE.

In the present volume—I had intended to have given the Solar and Planetary and other observations for 1838—1840, which circumstances had compelled me to omit in the fifth volume; but as the computation and printing of the Catalogue has proceeded, the vast number of figures to be gone over, added to the fact of my time having been much taken up at distant stations with other duties, has left me little or no leisure to attend to the other computations; added to this,—the consideration that the present Catalogue is a work in itself of considerable importance, and sufficiently distinct from other Astronomical observations, I have thought it advisable again to postpone the Solar and Planetary observations, and give the Catalogue as it now stands in a separate volume.

To have rendered the present volume complete in itself, I should perhaps have explained minutely the dimensions of the instruments employed and the manner in which they have been used, have traced the history of the existence and discovery of the error of division, and finally have exhibited specimens of computation and formulæ &c. &c. but considering that these expalnations have already been given in the former volumes of this work, and regarding the present volume merely as a corrected copy of the several catalogues they contain, I have thought it unnecessary again to enter into detailed explanations; I have however as far as regards the *now corrected* Declinations, instituted a comparison between the places in the Catalogue and those given in the Nautical Almanac, the result of this comparison exhibits—that the Madras Mural Circle when corrected for error of division—agrees in almost every case to a wonderful degree of exactness with the Greenwich Instruments; in the few cases however,—where a less perfect accordance is met with, the discrepancies appear more like errors of observation or reduction than those resulting from the instruments employed. By way of attracting attention to the proper motions of the fixed stars, a subject, which,—principally for want of data has hitherto been much overlooked, I have given a table of all the Stars in which either the observations of Piazzi or my own have exhibited a proper motion exceeding a quarter of a second of arc: amongst the several instances in which a variable amount of proper motion is here met with, in some cases discrepancies no doubt exist, but in others—it will be for future Astronomers to determine the amount and law of variation: that the present volume may assist in so interesting an enquiry is the utmost limit of my ambition.

Madras Observatory, *June 10th* 1844.

T. G. TAYLOR,
H. C. Astronomer.

N. B. The Longitude of the Madras Observatory has hitherto been assumed at 5^h, 21^m. 3^s. 8 E. of Greenwich, but from the Moon Culminating Stars observed between 1838 & 1843—compared with Greenwich (including observations of the ***second*** as well as first Limb of the Moon) I am enabled to state—approximately, that the Longitude comes out 5^h. 20^m. 57^s :—the Latitude continues to be assumed at 13°. 4′. 9″. 2 N.

T. G. T.

THE

MADRAS GENERAL CATALOGUE,

OF THE

PRINCIPAL FIXED STARS.

In Volume I. of the "Results of Astronomical Observations made at the Madras Observatory," —is given a catalogue of the Mean places of 1118 of the principal fixed Stars, reduced to the commencement of the year in which they were observed (Jan. 1, 1831); in the second volume of the same work—results for 1832 and 1833, re-observed places of several of these Stars are given, and the catalogue enlarged so as to comprehend all the visible stars of the Royal Astronomical Society's Catalogue (2881 stars). In the third volume,—results for 1834 and 1835, a few of the stars of the above catalogue had accidentally been re-observed and are included in the catalogue 3003 stars there given. In the fourth Volume,—results for 1836 and 1837, the re-observed places of a few of the afore mentioned stars are given, and a further catalogue of 2066 stars observed, comprising in all, the catalogue of 7646 stars observed by Piazzi; finally in the fifth Volume—" results for 1838 and 1839,"—will be found a catalogue of 3445 *southern* stars, which had been selected with reference to the Paramatta catalogue,—making altogether about 11000 stars: all of these stars had been observed with the same instruments and were reduced by the same formula, and it had been assumed, that the *error of division* was too small to require my particular attention; towards the conclusion of the fifth Volume however, just before proceeding to England in 1840, a systematic error of considerable magnitude had been discovered in the division of the Mural Circle, and its amount accurately ascertained for each single division; thus equipped, on my return from Europe in 1842, I immediately commenced the embodying these several catalogues into one, correcting each place for the error incident to the divisions on which it had been observed, and reducing the whole to Jan. 1, 1835, or about the middle period of the observations; whilst this—which has been performed twice over, was in the course of computation, I was enabled to re-observe several stars whose places gave large proper motion as

compared with Piazzi, or differed much when compared with the Paramatta catalogue, these too, the observations to the end of 1843—have now been added to the former results, and constituted what is here called the " *Madras General Catalogue.*"

In reducing these catalogues to a common epoch, in a general way—the annual precession alone has been employed, but in all cases in which the proper motion was found to exceed half a second of space, and in a few cases where the Madras results ***inter se*** have exhibited a proper motion exceeding 0",25 and ***the same as been confirmed by Piazzi or Brisbane,***—in each of these cases the proper motion has been admitted in the final reduction to 1835. The annual precessions have been computed from formula

$$* \quad d\,\alpha = +\ 46{,}0602'' + 20{,}0572''\ \sin\ \alpha\ \tan\ \delta$$

$$d\,\delta = +\ 20{,}0572''\ \cos.\ \alpha$$

These likewise have been computed for the year 1835, but may readily be adapted to any year by the help of the columns $d^2\,\alpha$, $d^2\,\delta$; thus, required the right ascension and declination of δ Urs. Min. for the year 1845; the work will stand thus—

		s.			"
$d\,\alpha$ for Jan. 1. 1835 =	—	19.224	$d\,\delta$ for Jan. 1. 1835	+	2.230
$d^2\,\alpha \times 5$ — — —	—	35	$d^2\,\delta \times 5$ — — —	—	.140
$d\,\alpha$ Jan. 1. 1840 =	—	19.259	$d\,\delta$ Jan. 1. 1840	+	2.090
Proper motion	+	.106	Proper motion	+	.100
Annual variation for 1840.	—	19.153	Annual variation for 1840.	+	2.190
		10			10
Variation in 10 years	—	3 11.53	Variation in 10 years		21.90
α Jan. 1. 1835. =		18 25 32.04	δ Jan. 1. 1835.	+	86 35 18.83
α Jan. 1. 1845. =		18 22 20.51	δ Jan. 1. 1845.	+	86 35 40.73

The annual proper motions in right ascension have mostly been copied from the former volumes of this work; they were derived from a comparison of the places of the several stars (***reduced to the commencement of the year in which they were observed***) with Piazzi's catalogue for the year 1800; the annual variation thus deduced —being compared with the annual precession computed for the middle year between 1800 and the date of observation, gave the annual proper motion; these proper motions are however generally speaking erroneous, and that too arising from two separate causes, but as the amount of error which may attach to them is of a debateable nature, I have thought it best to reprint them in their uncorrected state, and then to enquire into the extent of the correction they may require. In the first place these proper motions are erro-

* Derived from Page cxix, Vol. IV.

neous by reason of a wrong assumption of the place of the Equinoctial Point, which at page 72 vol. IV. was found to be behind its true place 0,144*s*, or, it would appear that each right ascension in the Catalogue should be diminished by this amount, and consequently that each proper motion should receive the correction$-\frac{0,144}{85}$ or —,0041 : in addition to this, the proper motions set down in the Catalogue, bear reference to a certain value assumed for the general precession of the Equinoxes, see pages XI & XII of vol. II part III of the Astronomical Society's Memoirs ; if the value here assigned by Mr. Bailly be acceded to, the correction just found alone is necessary to reduce the tabulated proper motions to the truth, but if the result arrived at—at page CXIX of volume IV (which has been employed in computing the annual precession in this volume) should be admitted, then—each proper motion in right ascension will require the further correction

$$-.0025-.0010 \sin \alpha \tan \delta$$

or altogether as follows.

Corrections due to the proper motions in A. R. from an error of 0,144*s*. *in the assumed place of the Equinox.*

Right Ascension.		Declination.							Right Ascension.	
		−70° +	−50° +	−30° +	0	+30° −	+50° −	+70° −		
H	H	*s.*	*s.*	*s.*	*s.*	*s.*	*s.*	*s.*	H	H
0	XII	,0066	,0066	,0066	,0066	,0066	,0066	,0066	XII	0

V	VII	,0039	,0054	,0060	,0066	,0072	,0078	,0093	XVII	XIX
VI	VI	,0039	,0054	,0060	,0066	,0072	,0078	,0093	XVIII	XVIII

That some correction of the nature here exhibited is necessary, is at once evident on inspecting any single page of the catalogue, where— a determination to the positive sign cannot be overlooked. On taking the mean of the P. M. in right ascension as well as declination, omitting only those Stars (which I have called "proper motions stars"), in which the amount reaches to 0″,25 of arc, we get as follows.

A table of the sum of + and — proper motions in each hour of A. R.

			s.				"
252	+	6231	+,00837	221	+	1486	—,0544
	—	1096			—	5872	

In the fourth volume of the " Madras results"—with the declinations *uncorrected* for error of division, I have shown that the amounts and irregularities exhibited by a table similar to the above, can be explained by the admission of an annual motion of the Solar system in space, to the amount of 0,"06, directed towards the North Pole of the Ecliptic, and the above table, in which the correction for error of division has been allowed—still exhibits the same tendency, but the importance of the subject renders further observation necessary before it would be safe to admit such a theory into our calculations.

The values of $d^2 \alpha$ and $d^2 \delta$ have been taken from tables of double entry (similar to those given at P. 113-114 of Vol. IV,) which were constructed for this purpose to five places of decimals, but in the course of re-examination—in a general way the values set down in the catalogue have only been tested as far as the first four decimals, beyond which in practice they will seldom if ever be required.

As a matter of precaution, which experience has shewn to be peculiarly necessary to works printed in India, before publishing the present work, I have caused the printed copy to be again read over with the Manuscript, the result has been, that an unusually large number of errors have been detected as now follows,—these corrected, the work will I believe be singularly free from error.

In the former volumes of the Madras Results I have exhibited the degree of dependance to be placed in the Madras determinations of Right Ascension or Declination by comparison of the one or the other with the places derived from other Catalogues; on consulting these volumes, as far as Right Ascension is concerned it will not perhaps be considered necessary here again to encounter the enquiry, but for the Declinations *as corrected for error of division*, it will not be uninteresting to note the degree of coincidence which now exists. The Catalogues which immediately offer for this purpose as being of high authority, are those derived from the Greenwich Observations as given in the Nautical Almanac; the first of these is stated to be derived from Mr. Pond's fundamental Catalogue for 1830, which Catalogue it must be noted had been observed in the years 1826—1829, or it will be

sufficient to assume 1827 as the approximate date of observation; the second catalogue is that given by professor Airy in the Nautical Almanac for 1845, derived from the Observations of 1836—1839, or January 1. 1838, may with sufficient accuracy be assumed as the epoch of Observation: if the latter catalogue be corrected for the Madras amount of proper motion between 1838—1845, and the former catalogue be likewise brought forward by the proper motion between the epochs (1827—1845) in addition to the amount due to precession,—the difference of either G′. or G″. from the Madras places (M.) will be found as follows.

Comparison of the Declination of 87 Stars of the Madras General Catalogue with the corresponding Greenwich places.

The above comparison, is, on the whole highly satisfactory, for it must be born in mind that the differences in many cases owe their magnitude to erroneous determination of the proper motion, or rather to combined smaller errors in the Madras or Palermo Catalogues; hence it may safely be assumed, that the Madras mural circle *when employed with its catalogued errors of division* possesses every advantage which could be derived from the most perfectly divided instrument :

At the conclusion of the catalogue given in Vol. V (Pages 156-176) an explanation is entered into relative to several blanks which occur, and a statement made of the number of Stars whose declination differed byless than 3″ or 6″ from the Brisbane Catalogue &c. much of which is modified by recent observation and by the allowance now made for error of division, thus

			″	
there are	1380	cases in which the difference B—T is below	2	
or	2364	—— — —— — ——— „ — ——	4

2448	1208	+0 9,51	** The Madras result confirmed but a proper motion of —1″ indicated.
2449	1210	+0 10,15	The Madras result confirmed by recent observation
2531	1253	—0 8,31	The Madras result confirmed by recent observation.
2616	1308	0 ——	Has been repeatedly looked for, but not seen.
2649	1329	—0 8,92	This Star has been overlooked.
2661	1336	—0 57,10	The Madras result confirmed ; the Brisbane place is 1′ in error.
2667	1339	+0 8,84	This Madras result confirmed by recent observation.
2704	1360	+0 11,67	This Madras result confirmed by recent observation.
2706	1362	+1 2,99	The Madras result confirmed ; the Brisbane place is 1′ in error.
2731	1379	—0 9,88	The Madras result confirmed by recent observation.
2747	1391	—0 10,64	This Madras result confirmed by recent observation.
2815	1438	—0 11,38	The Madras result confirmed by recent observation.
2849	1467	—0 8,02	The Madras result confirmed by recent observation.
2855	1474	—0 11,87	* The Madras result confirmed but a proper motion of +1″ indicated.
2870	1480	+0 10,83	The Madras result confirmed by recent observations.
2881	1487	—0 8,09	Observed in 1840, 1841 and 1844.
2882	1490	—0 13,94	The Madras results confirmed.
2889	1491	—0 8,61	This Madras result confirmed.
2913	1501	+1 5,08	The Madras result confirmed ; the Brisbane place in error.
2918	1503	—0 16,71	I have allowed a proper motion of +1,″7 which will reduce this difference greatly.
2955	1531	+2 49,55	The Madras result confirmed by recent observation.
3010	1570	+1 2,17	The Madras result confirmed ; the Brisbane place is 1′ in error.
3017	1579	—1 1,98	The Madras result confirmed ; the Brisbane place is 1′ in error.
3050	1603	—0 9,09	Recent observations would diminish this difference 1″
3084	1633	—0 25,66	I have allowed a proper motion +2,″8 as derived from the Madras observations which will [greatly reduce this difference.
3100	1645	+1 45,38	This is the nearest Star to B. 1645.
3136	1662	—1 3,65	Madras result confirmed : B. catalogue 1′ in error.
3166	1685	+1 16,91	It would appear that observation k^2 Naris has been re-observed for this Star : from 3 re- [cent observations Dec. for 1835 = —26°18′44″73 differing 6′ from the B. catalogue.
3170	1688	+0 10,14	The Madras result confirmed by recent observation.
3231	1738	—0 12,66	The Madras result confirmed by recent observations.

† The observations of this Star were made in 1810—1813, hence the place in the catalogue for 1835 requires to be corrected for 6 years proper motion.

‡ Two observations in 1844 place this Star 2″ to the South of the place set down in the catalogue.

** The observations of this Star were made in 1833—1839, hence the place in the catalogue for 1835 requires to be corrected for 4 years proper motion.

* This Star was observed in 1838 consequently the place in the Catalogue for 1835 requires to be corrected for 3 years proper motion.

Memoranda regarding those Stars whose Declination differs above eight seconds from the Brisbane catalogue.

10967	7361	—0 15,02	The Madras result confirmed by recent observations.

* This Star was observed in 1840, hence 5 years P. M. must be applied to the catalogue.
** This Star was observed in 1840. hence 5 years P. M. must be applied to the catalogue.
*** This Star was observed in 1841, hence 6 years P. M. must be applied to the catalogue.
† This Star was observed in 1841, hence 6 years P. M. must be applied to the catalogue.

PROPER MOTION OF THE FIXED STARS.

In the early pages of this volume it has been shewn, that the Madras General Catalogue when compared with Piazzi, exhibits 252 cases in A. R. and 221 in declination in which the resulting proper motion exceeds that which might arise from the ordinary errors of observations; with a view of comparing these with the proper motions assigned by Piazzi—I have applied to each of our proper motions the correction — 0,007*s* for A. R. and + 0,″05 for declination, and have converted the former—which are in time, into *arc;* in addition to this, in the pages which follow I have given all the cases of proper motion from Piazzi not included in the above which exceed 0,″25, both in A. R. and declination, thus

A Catalogue of proper motion Stars.

11006	276	+0,50	——	—0,19	——	

The above table was drawn out in the first instance for my own information and guidance, but will not I imagine prove otherwise than acceptable and useful here; it exhibits in a general way,—that the proper motions observed by Piazzi agree with those now determined within the possible amount of errors of observation; there are however 33 cases for right ascension, and 11 for declination, in which this limit is so far exceeded, as to leave no doubt—either that errors of reduction or otherwise exist in the catalogues of Piazzi, Flamstead, Bradley &c. independant of those incidental to the observer, or, *that the proper motions themselves are of variable amount*; with a view of arriving at a just conclusion on this point, the Madras places will again be re-examined and re-observed, and I need hardly intimate to those Astronomers who have the means of examining the places of Flamstead, Bradley, La Caille &c.—how very acceptable a re-confirmation of their results will now prove.

FINIS.
